

Sample Center-level and Physician-level Variation Reporting

The M2S PATHWAYS Analytic Engine can now display variation across centers **in the entire VQI or in a Regional Quality Group** for the variables in each procedure type, including risk-adjusted outcomes where appropriate. This example shows “My Center” (dashed vertical line) compared with all national participants in VQI, for the observed and expected length of stay (LOS) after elective endovascular AAA repair (EVAR):

A Regional Quality Group perspective of the same data shows how “My Center” compares with all participants in the Regional Quality Group, for the observed and expected (based on differences in patient characteristics) LOS after elective EVAR:

Vascular Quality Initiative®

vascularqualityinitiative.org

Variation can also be displayed at the **physician-level**, for all national, regional or “My Center” physicians. This example shows variation in the percentage of patients who are discharged on a statin and antiplatelet medication after carotid endarterectomy (CEA) **in one region**, showing the “My Physician” result at the vertical dashed line compared to other physicians in “My Region”.
